# Let us help you design the ideal permanent access solution for all your exterior maintenance needs.

## WALL AND ROOF ANCHORS

Designed to provide a secure tie-off for personal fall protection on lifelines or as an anchorage for tying back roof rigging equipment for suspended scaffolds. The wall and roof anchors bolt securely into an approved concrete structural member that can carry the loads applied. Or the anchor can be embedded into the concrete when it is poured during construction.

## FALL RESTRAINT SYSTEMS

Fall restraint systems allow your workers to safely access areas without sufficient parapet protection or other potentially dangerous working areas like near a roof ledge. These systems are popular because they allow workers to travel long distances without detaching their lanyards from the cable. (Horizontal cables should not be used for hanging or direct rigging.)

## DAVIT ARMS

Davit arms are used to support suspended scaffold systems. We can design a variety of sizes, including adapters to fit existing pedestals, depending on your parapet, wall conditions and your needs.

## EQUIPMENT TESTING

Big City Access provides equipment testing throughout the state of Texas. Our engineers have a wide range of expertise with all types of anchor-davit window washing & general maintenance systems for building facade access & industrial working surfaces. Certification of these systems ensures that building owners and property managers are in compliance with the latest OSHA and ANSI standards. Our services include the proof load testing and visual inspection of fall protection anchors, davit bases, davit pedestals, davit arms, tie-backs, outriggers, monorails and other permanently mounted facade access and fall protection equipment.

**Four Texas locations to serve you.**
